Abstract. The aim of this research work is to carry out fault analysis of 11KV distribution power system. Electric power is an essential facilitator for sustainable development of the modern nation state. While Nigeria is reported to suffer from severe shortages of electric power the condition of some of its newer constitutional units are unknown. In this work, electric power infrastructure and energy availability is studied for Ado-Ekiti, the principal economic and political hub of Ekiti State.

The motor is drawing 10MW at 0.8 leading power factors and a terminal voltage 11KV when symmetrical three phase fault occurs at the motors terminals. Determine the generator and motor currents. Also determine the fault current. Two generators G1 and G2 are rated 15MVA, 11KV and 10MVA, 11KV respectively.

Selecting P base as 20 MVA and V base as 11 kV and using the above equations: and the Line-Neutral voltage on the secondary of the transformer is $0.4\sqrt{3} = 0.230$ kV, giving: Three Phase Fault Example Three Phase Fault Example. Per unit analysis can be used to calculate system three phase fault levels and the current distributions.

Abstract: Fault level analysis in power distribution system is important issue in power system protection study. Demand of power increases day to day. So, continuous power supply to the consumer is necessary without any interruption. Fault analysis in power distribution system is necessary for selection of proper protective devices such as relays and circuit breakers.
