Summary: 1.1 AN OVERVIEW OF MARKOV DECISION PROCESSES
The theory of Markov Decision Processes-also known under several other names including sequential stochastic optimization, discrete-time stochastic control, and stochastic dynamic programming-studies sequential optimization of discrete time stochastic systems.

In mathematics, a Markov decision process is a discrete-time stochastic control process. It provides a mathematical framework for modeling decision making in situations where outcomes are partly random and partly under the control of a decision maker. MDPs are useful for studying optimization problems solved via dynamic programming and reinforcement learning. MDPs were known at least as early as the 1950s; a core body of research on Markov decision processes resulted from Ronald Howard's 1960 book

A Markov Decision Process is an extension to a Markov Reward Process as it contains decisions that an agent must make. All states in the environment are Markov. In a Markov Decision Process we now have more control over which states we go to.

Stochastic games generalize both Markov decision processes and repeated games. Two-player games. Stochastic two-player games on directed graphs are widely used for modeling and analysis of discrete systems operating in an unknown (adversarial) environment. Possible configurations of a system and its environment are represented as vertices, and ...
