### System Specification Based Network Modeling

In this research, we apply a modeling methodology to construct the valid model of computer network focusing on its vulnerability for survivability testing. To accomplish our aim, the appropriate modeling method should be defined. Especially, we take advantage of the system specification based modeling approach to construct valid network model.

A novel network-based model is first established by constructing a PI control system and taking network-induced delays and stochastic packet dropouts into account. By using two different artificial delays to characterize the update of proportional and integral control signals, the network-based PI control system is modeled as a stochastic impulsive system with two input delays and reset equations at updating instants.

With the implementation of its new network modeling system, KCBPU has improved the quality of the information available to field crews. Laptop computers still make network maps available, but

now the maps are generated from a single source, making the maps more accurate.

A network model is a database model that is designed as a flexible approach to representing objects and their relationships. A unique feature of the network model is its schema, which is viewed as a graph where relationship types are arcs and object types are nodes. Unlike other database models, the network model's schema is not confined to be a lattice or hierarchy; the hierarchical tree is replaced by a graph, which allows for more basic connections with the nodes.

The network model is a database model conceived as a flexible way of representing objects and their relationships. Its distinguishing feature is that the schema, viewed as a graph in which object types are nodes and relationship types are arcs, is not restricted to being a hierarchy or lattice.. This can impose a high potential for design failures, because the network will not meet the business or applications' requirements.
